Document Purpose and Audience

SDS of simple web social software

* This document is mainly for the developers

* This software design specification is made with purpose of outlining the book network software architecture and design of the leader and it guided them to can add or publish the information between together

*And this document facilitates communication and understanding of the system by providing several views of the system design

Software Purpose

Our project “Book Network” is like virtual reading

.this document is to present a detailed description of the book network and provide overview of our software

.this software is available source and guided to who wants to read book and rating it online

It's provide effective communication between the whole . readers

Software scope

-The book network is a designed social website

-This software system is provided the leader to read online and reviewing

-The software helps them to interact together by sharing knowledge

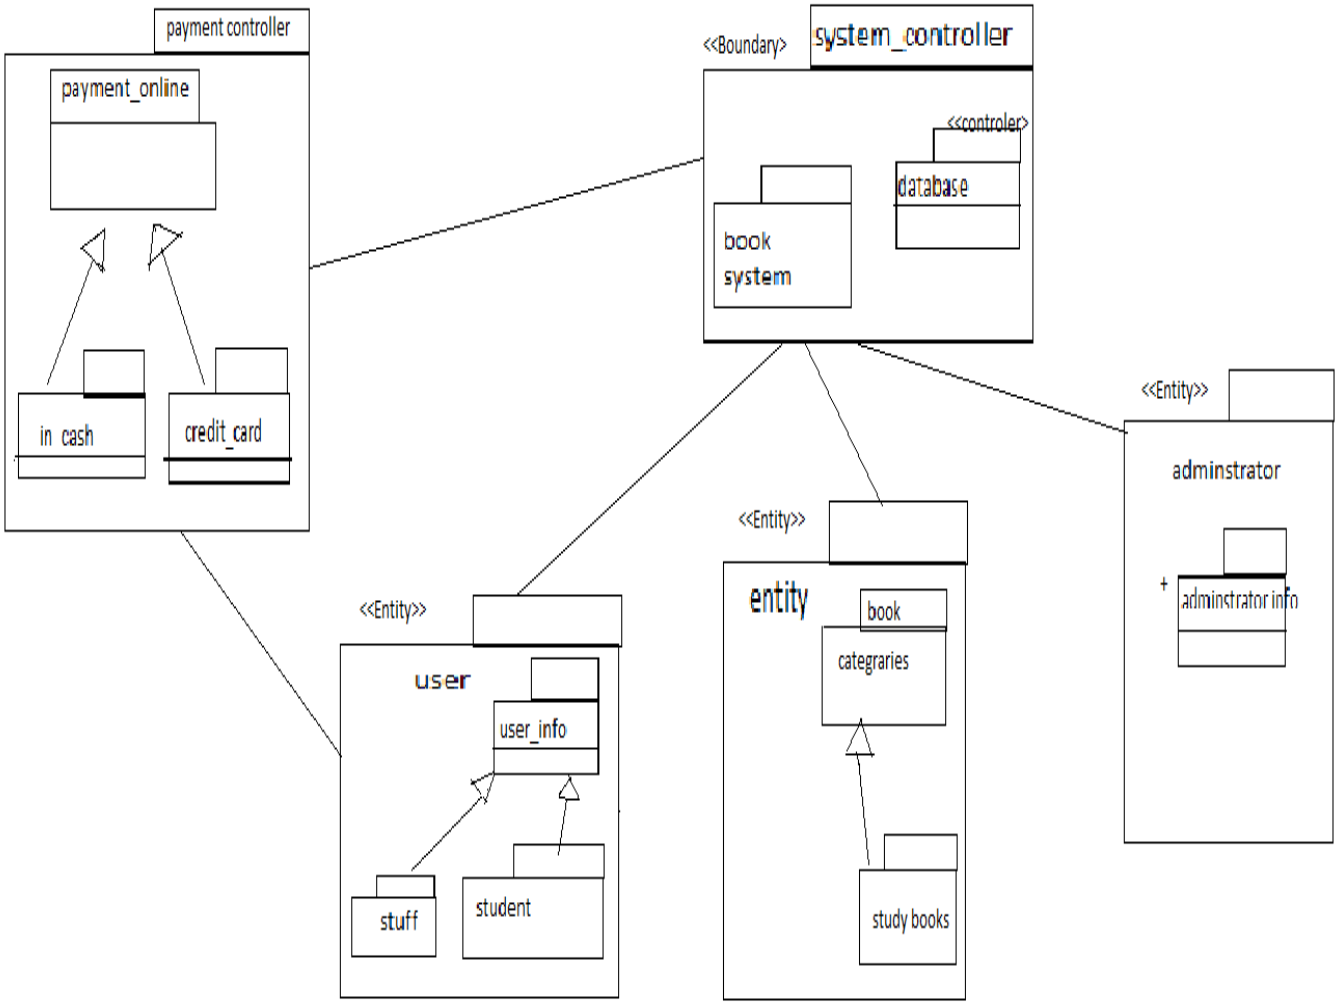
-It allow the leaders to edit or manage the books and storing it as needed

The software enables them to communicate with each other for -the specific book

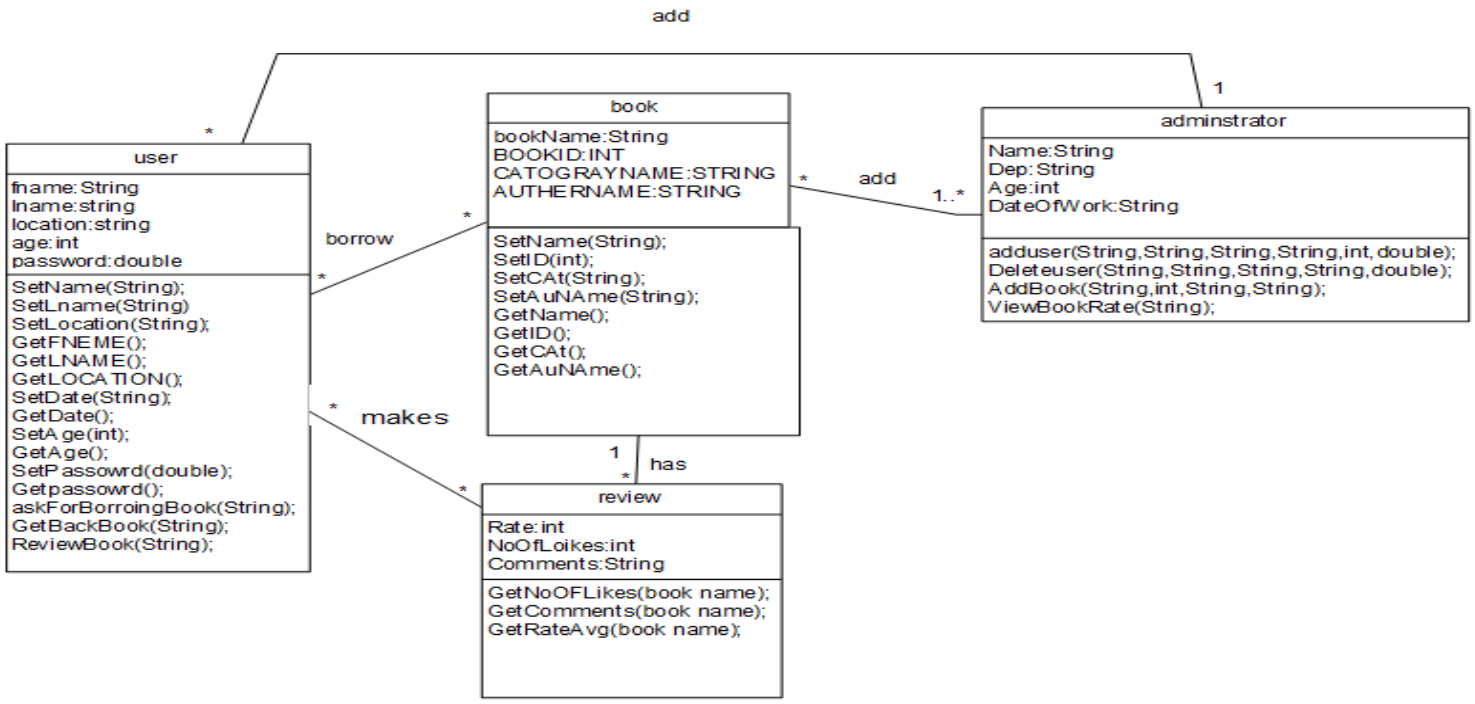
-It's a good library storing and easy to get brilliant books

The software helps reader and users to add and comment on it

System Decomposition



Class diagrams



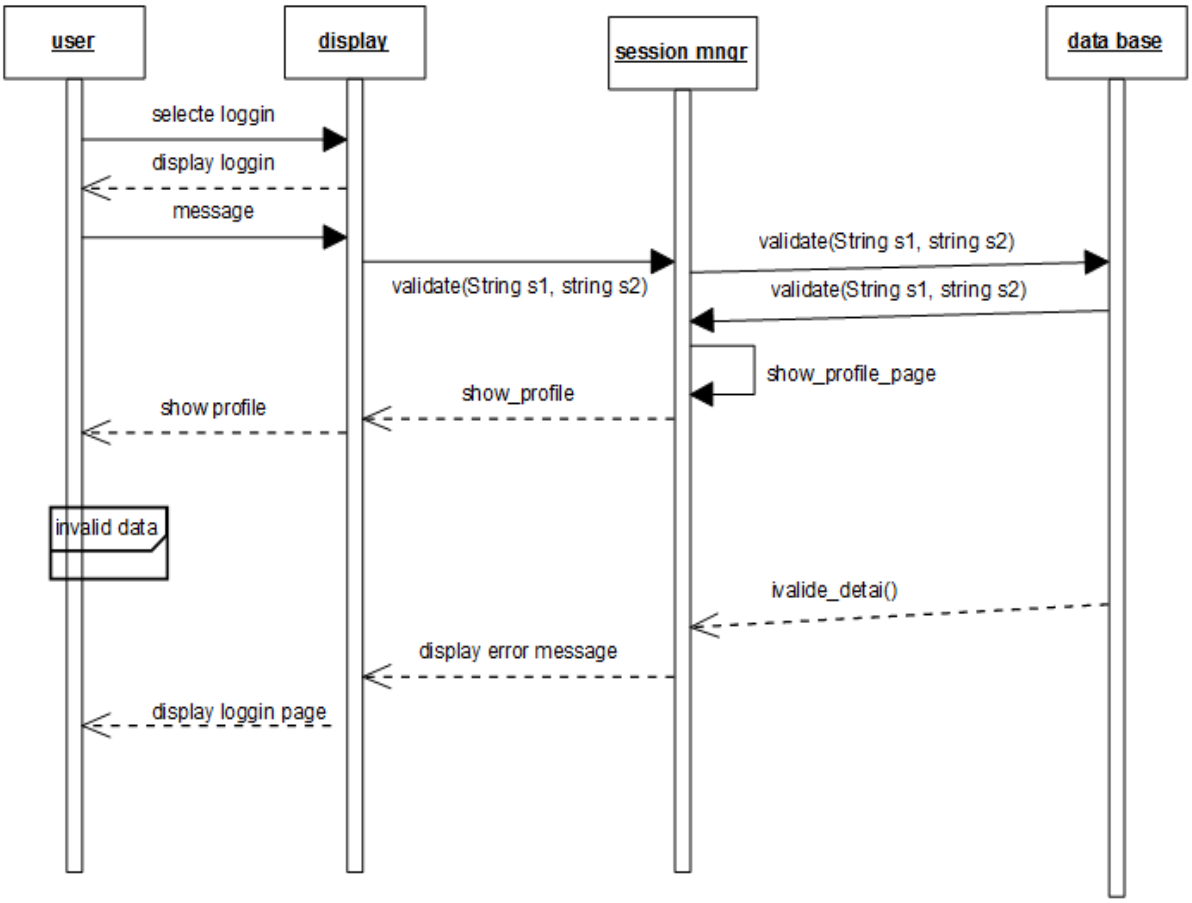
Important Algorithm

***Our software system is to permit leaders to communicate with each other by their accounts "sign up" "login" "publish" cross functions connected to database control**
***The "book network" gives opportunity for rating for books and appreciating**
***There will be admin who manage the website and make a control on user's activates**
***This is a good example before we implement it**
***The website works like ……**

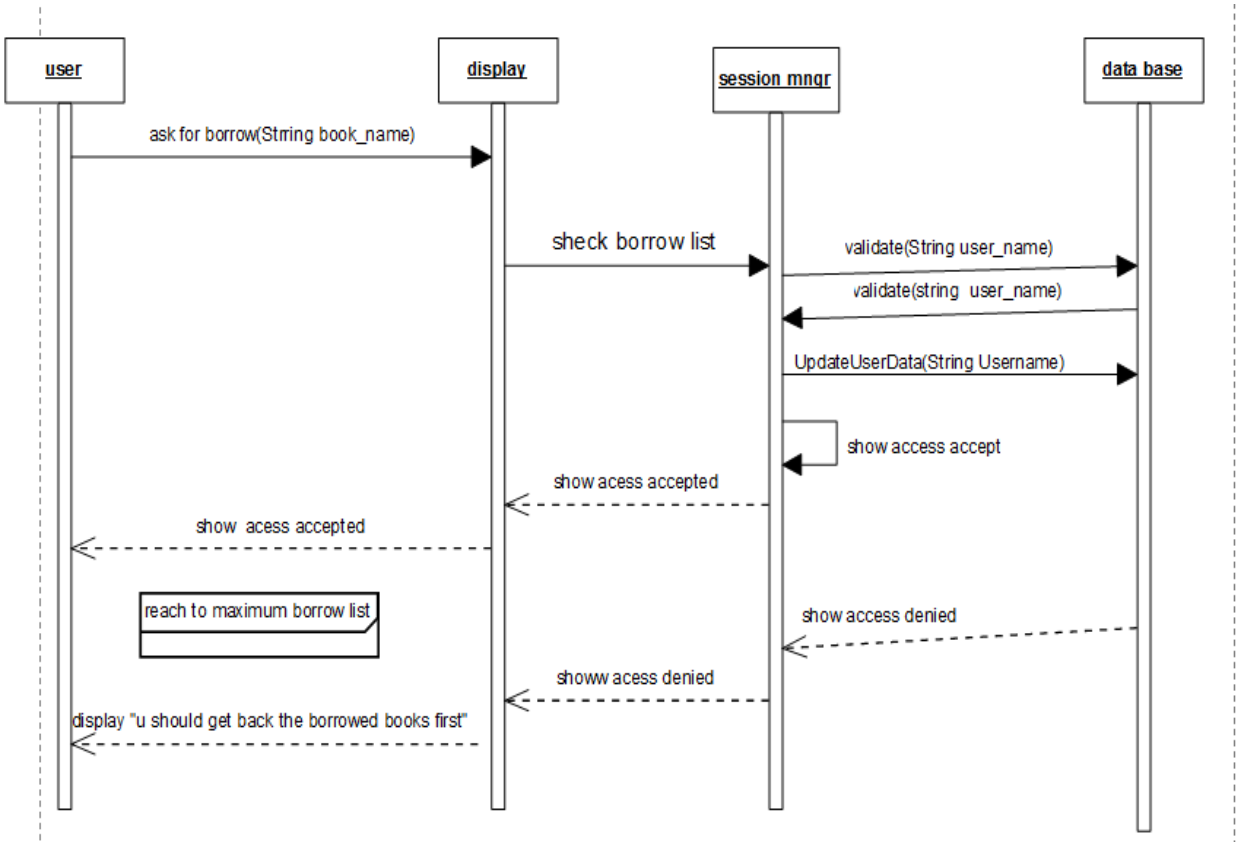
1-The user first sign up his name fname / lname / and create a password .
2- he will receive a message to confirmation .
3-now the user has an account to access the website .
4- he can easily read the books and communicating with the members .
5- he can rating [*****] the books and make likes / comments
6-after the user gets all needs he will log out the web

Sequence diagrams

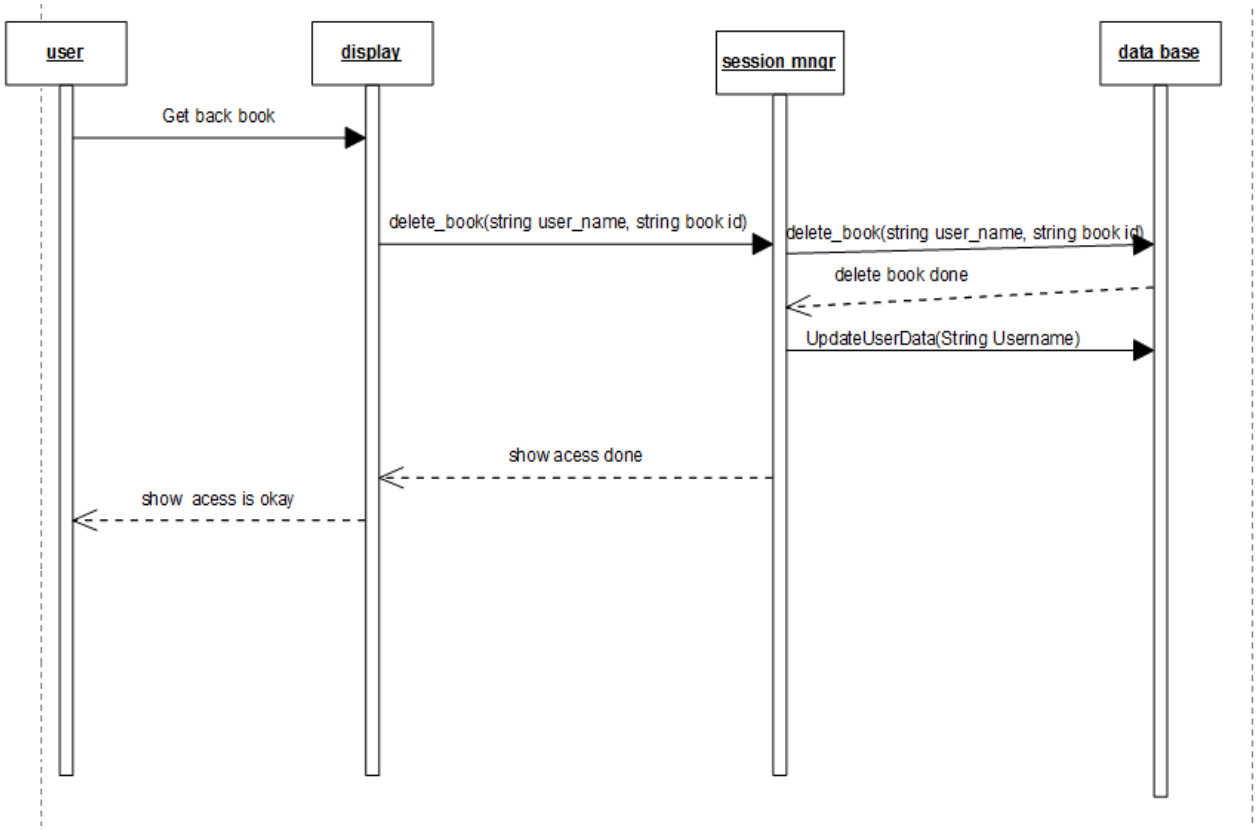
.Sequence ID : 1 login in into the system •



Sequence ID=2 borrow book



Sequence Id=3 getting back book



Class Name	Sequence Diagrams	Overall used methods
E.g. user	Id 1 to log in the system	Reade books
Borrow	Id 2 to check the books that are have big rating	Display high books are reading now
Getting back books	Id 3 to make user get books	Show access done
